

Creating a microservice app with Shuttle

... well, how to guard access with JWTs

About me

- Pieter Engelbrecht
- But known as **chesedo** on online forums
- Tech lead at **Shuttle**

- Gateway
 - /order -> Order service
 - /user -> User service

What is a JWT anyway?

Is used for authorization

JSON Web Token is made up of 3 parts:

1. Header
2. Payload
3. Signature (base64(header) . base64(payload))

Header

```
{  
  "alg": "HS256",  
  "typ": "JWT"  
}
```

Payload

```
{  
  "sub": "1234567890",  
  "name": "John Doe",  
  "iat": 1516239022  
}
```

Signature

```
eyJhbGciOiJIUzI1NiIsInR5cCI6IkpXVCJ9.eyJzdWIiOiIxMjM0NTY3ODkwIiwibmFtZSI6IkpvaG4gRG9lIiwiaWF0IjoxNTE2MjM5MDIyfQ.XbPfbIHMI6arZ3Y922BhjWgQzWXcXNrZ0ogtVhfEd2o
```

Payload fields

- Registered (RFC 7519)
 - iss = Issuer
 - sub = Subject
 - aud = Audience
 - exp = Expiration Time
 - nbf = Not Before
 - iat = Issued At
 - jti = JWT ID
- Public
- Private

- Gateway
 - /order -> Order service
 - /user -> User service

Best practices

Keep the payload compact

Short expiry

Don't have sensitive information in the payload

Don't send the token in the request params

Not ideal for session management
